

Swing Carriages

Swing Carriages - The maximum load capacity intended for forklift jibs in both the extended or retracted positions vary from 1935 pounds to 6000 lbs. It is a good suggestion to ask a material handling specialist about the restrictions for your specific use. The load capacity ratings are really for the jib itself and not the lift truck or even the utmost load which can be carried securely making use of a particular lift truck. It is very important remember that each time whatever accessories like for example a lift truck jib are attached to the forklift, the new center of gravity made by the accessory would reduce the general lift capacity of the forklift. There are instructions available which offer information on how to correctly gauge these load limits.

Prior to utilizing any lift truck jib, be sure that the shackles and hooks are correctly secured to the forklift. Make sure and even double check that the pins are tight. It is imperative that the weight calculations are properly made and double checked. Bear in mind to consider the truth that rated capacities at times lessen whenever the boom is in an elevated position, every time the boom is fully extended with telehandlers or even every time the mast is tilted forward.

A few important tips concerning the modifiable jib are: don't ever pull a load with a forklift jib attachment, because these kinds of attachments are really designed for vertical lift only. Always lift the load without letting it swing. Use extreme caution any time a load is carried to be able to avoid tipping over the truck.
